

Topic interest: English

Q1860 · period 24m · metric share · report date 2026-09-26

Summary

- pl: interest is declining by 9.7% per year (~43.52 views per million); confidence high
- cs: interest is declining by 12.3% per year (~48.3 views per million); confidence high
- uk: interest is declining by 16.0% per year (~119.54 views per million); confidence high
- de: interest is stable (~34.4 views per million), no significant trend; confidence medium

By language

Lang	Article	Views/mo	Per M	Trend, %/yr	Signif.	Confidence
pl	Język angielski	8 178	43.52	-9.7	yes	high
cs	Angličtina	2 865	48.30	-12.3	yes	high
uk	Англійська мова	6 773	119.54	-16.0	yes	high
de	Englische Sprache	24 255	34.40	-0.3	no	medium

Recommendation

Top candidate: uk (score 0.652): 119.54 views per million, trend -16.0% per year, confidence high. Next: cs (score 0.425). Research next: uk, cs, pl.

Why this order: uk: score 0.652; volume 119.54 per million (100% of the leader); trend -16.0% per year counts toward the score; confidence high. cs: score 0.425; volume 48.3 per million (40% of the leader); trend -12.3% per year counts toward the score; confidence high. pl: score 0.417; volume 43.52 per million (36% of the leader); trend -9.7% per year counts toward the score; confidence high. de: score 0.353; volume 34.4 per million (29% of the leader); trend not significant, so it adds nothing for growth; confidence medium.

Criteria: growth=0.6, volume=0.4, min_confidence=low, min_views=0. The score is computed by code with this formula; low confidence lowers the score.

Assumptions and limitations

pl: significant decline ($p=0.0007$), -9.7% per year. **cs**: significant decline ($p=0.0005$), -12.3% per year. **uk**: significant decline ($p<0.0001$), -16.0% per year; strong seasonality (amplitude 0.32). **de**: trend not statistically significant ($p=0.9407$): changes are indistinguishable from noise.

Wikipedia page views are a signal of attention, not of willingness to pay. Share per million compares language editions, not country audiences: readers of an edition can live anywhere. Some bot traffic is not caught by the agent=user filter. Since 2024 overall Wikipedia views have been falling due to AI answers in search; per-edition normalisation compensates for this only partially.
